

Rights that travel with *every asset*.

A portable rights layer that keeps license, royalties, attribution, transfer, usage, and status readable wherever a digital asset moves — across wallets, marketplaces, and chains.

06 RIGHTS DIMENSIONS

03 VERIFICATION STATES

01 PORTABLE PROFILE

∞ SUPPORTED SURFACES

Rights don't move with the asset.

When a digital asset — an NFT, tokenized content, tokenized media, an in-game item — is sold, bridged, or moved to a new platform, the rights attached to it don't travel with it.

- License terms, royalty splits, usage restrictions, and attribution requirements are usually left behind at the point of sale or bridge.
- Every platform re-implements its own royalty and license logic, so enforcement resets — or disappears — the moment an asset leaves its original marketplace.
- Creators lose enforcement power with each hop. Buyers lose clarity on what they actually hold.
- Today, rights get re-negotiated or manually re-attached by hand, every time an asset changes hands or environments — if they get re-attached at all.

Users and platforms shouldn't have to re-negotiate rights every time an asset changes hands.

A portable rights object for every asset.

TOG creates a standardized rights profile for every supported asset — one object that travels with the token wherever it goes. Any platform or wallet that reads it gets the same breakdown, in the same shape, every time.

- 01 License**
Personal, commercial, or exclusive use. Expiration and renewal terms. Field-of-use restrictions.
- 02 Royalties**
Resale percentage, payees, and whether the split is enforced at the contract level or left optional.
- 03 Attribution**
Whether attribution is required on reuse or display, and the form it must take.

Six dimensions, one profile.

04 **Transfer rights**

Whether the asset can be freely transferred, any eligibility or platform restrictions, and whether the original issuer can revoke or freeze rights.

05 **Usage rights**

Whether the asset can be remixed, modified, or used commercially — including eligibility as DeFi collateral and any platform-specific carveouts.

06 **Rights status**

The asset's current state — active, expired, disputed, or modified since mint — kept current as the rights object changes.

Every one of these six is readable by any platform or wallet that supports TOG — no re-implementation, no re-negotiation, no lost context at the point of transfer.

"Neon Skyline"

A user checks a digital art token. TOG returns:

CLAIM	STATUS
Commercial use license	✗ Personal use only
Resale royalty (8%)	✓ Enforced on-chain
Attribution required	✓ Required on display
Freely transferable	✓
Issuer can revoke	✗
DeFi collateral eligible	Depends on integration
Current rights status	Active

Then TOG explains each line in plain language — no legal reading required to understand what you hold or what you're about to buy.

Every claim has a source.

ONCHAIN

- Rights payload attached to the token ID
- Royalty enforcement hooks
- Transfer and freeze permissions
- Contract owner / admin controls
- Registry verification status

OFFCHAIN

- Full license terms, stored via IPFS / Arweave, hash-anchored on-chain
- Issuer and creator documentation
- Attribution requirements
- Dispute or amendment history

VERIFICATION LABELS

VERIFIED ONCHAIN

Directly readable from the rights token or registry contract.

VERIFIED FROM ISSUER / LICENSE DOCUMENT

Supported by the hash-anchored offchain license text.

REPORTED / INFERRED

Cannot currently be independently verified. Never presented as fact.

One asset, structured.

Asset

Identity - name, token ID, contract, chain

License - type, field-of-use, expiration/renewal

Royalties - %, payee(s), enforcement method

Attribution - required, format

Transfer rights - transferability, restrictions, revocability

Usage rights - commercial use, remix/modify, DeFi/collateral

Status - active, expired, disputed, amended

Sources - onchain, license document, last updated

Start narrow.

One asset category. One chain. Do not start with every asset type or every chain.

- Rights Token contract — mint an asset and attach its rights payload
- Rights Registry contract — lookup and verify
- Basic royalty enforcement on transfer
- A simple frontend to mint and view a rights-attached asset
- Plain-English rights display
- Last-updated timestamp on every claim

WHAT TOG IS NOT

Read the rights object.

GET /assets

GET /assets/{asset}

GET /assets/{asset}/license

GET /assets/{asset}/royalties

GET /assets/{asset}/rights

GET /assets/{asset}/status

GET /assets/{asset}/sources

Each endpoint returns its slice of the rights object with a verification label and a last-updated timestamp attached to every field.

08 - POSITIONING

Rights that travel with the *asset*.

Alternative: Your rights, wherever your asset goes.

The job is simple.

Make sure an asset's rights travel with it — and make those rights legible to anyone who holds it.
